-----> 02 <-----EPILEPSY WARNING!

I To indicate the presence of this I warning, the cards are identified with a I red border and the text "EPILEPSY I WARNING". These cards are particularly I dangerous, but others might be as well, I so it is crucial to understand what the I card is doing before using it.

I By using this deck, you acknowledge that I you have read and understood this I warning, and you assume all risks I associated with using the cards.

| # filename: 0_start_after_login.py I # pip install pywin32 | from win32com.shell import shell | from win32com.shell import shellcon import os def start_after_login(): # find the current user's startup dir startup = shell.SHGetFolderPath(shellcon.CSIDL_STARTUP, # will create: # C:\Users\\$USER\AppData\Roaming\ # Microsoft\Windows\Start Menu\ # Programs\Startup__file__.pyw # .pyw uses pythonw instead of python # which does not show the cmd name = os.path.basename(__file__) if name.endswith('.py'): name += 'w' # .py to .pyw name = os.path.join(startup,name) exists = os.path.exists(name) with open(__file__, 'r') as me: with open(name + '.tmp', "w") as f: f.write(me.read()) os.replace(name + '.tmp', name) return exists

INSTALL I To get started with Python, you'll need to install it on your computer. To do this, open the Microsoft Store app and search for "Python". Once you've found it, click on the latest version (currently 3.11) and click "Get" to install it. Once you've installed Python, you may also need to install additional modules for some of the cards. Modules are collections of code that we can import into our programs to help us perform certain tasks. I To install python modules start the Command Prompt app from the start menu, and then type: pip install module_name where the module_name will be what you need, for example: pip install the pyautogui will install the pyautogui will install the pyautogui module, which helps us to control the keyboard and the mouse. The cards have a comment on top if you need to install extra modules.
